

# New App “KITS” for digital service

Press release 02/2020  
KELLER ITS

Modern information and communication technology offers innovative solutions for providing information and data regardless of the location far beyond the current practice. Digitalization thus opens interesting fields of action for companies, especially in terms of service.

KELLER ITS – one of the leading manufacturers of optical temperature measuring devices – follows this development and presents the new information and service app “KITS”. The App implements the different possibilities of a modern digital service concept.

The Industrial Solution Guide in KITS helps prospective customers in selecting the most suitable device and accessories for their industry and application. All information available on a product, such as technical data, operating and commissioning instructions or dimensional drawings are directly available on site via the app on the smartphone or tablet. For this purpose, you simply scan the barcode or enter the type of instrument. For the electrical connection, the setup of the measuring system or in case of any malfunctions it is no longer necessary to search for the documents.

The field-of-view calculator is a useful tool for selecting the optical property of the instrument as well as for setting the appropriate focus distance of the pyrometer during commissioning. The emissivity calculator is an important tool for setting the parameter of the device to find the correct emissivity setting. In addition, you are able to determine the real measurement uncertainty under the given measurement conditions.

For quick help, our service hotline is directly available. The KITS App currently supports 8 languages and meets the requirements for a modern service management to get all necessary information quickly, easily, at any time and worldwide.
